I tried exploring the app by entering dance as the child's interest, and it suggested Performing Artist as a career. However, I feel the app could go much deeper to provide meaningful, personalised career guidance.
For instance, once a child expresses an interest in dance, the app should ask follow-up questions about the specific dance form they are interested in, their current level of training, and their location.

If the child is interested in Bharatanatyam, the app should then provide insights into:

- **Current opportunities in the chosen location:** What is the scope for Bharatanatyam in that city? What performance opportunities, teaching avenues, academies and other career options are available?
- **Mentors and training**: Identify established gurus, dance schools and mentors in the area, ideally with links to Google Maps so parents can explore their locations and evaluate suitable options.
- **Performance landscape**: Highlight recent major performances, festivals, cultural events and other relevant opportunities in the city.
- Opportunities beyond the home city: Explain the scope for Bharatanatyam in other Indian cities and overseas, including places with established Indian classical arts communities and performance circuits.
- **Future career prospects:** Based on current trends and available evidence, explain what the career could look like by 2030, including opportunities in performance, teaching, choreography, cultural institutions, digital content and interdisciplinary collaborations.
- **A personalised development roadmap:** Once the child's interests, age, experience and aspirations are understood, suggest a practical plan to build the necessary skills, gain exposure, exams (if any), link to the exam websites etc... and work towards relevant opportunities over the next 12 months.

- **Social media presence and personal branding**. Today, for Bharatanatyam performers and many other budding artists, Instagram and other digital platforms play a significant role in building visibility, reaching audiences, getting performance opportunities and establishing a reputation.

The app could guide aspiring artists on how to build their online presence, create engaging content, showcase their performances, connect with relevant cultural organisations and event organisers, and develop a personal brand. It could also provide guidance on content strategy, audience engagement and responsible digital promotion.
Knowing how to showcase that talent and reach the right audience can make a real difference to an artist's career.

The key is to move beyond simply identifying a broad profession and generating a generic activity plan. The app should help parents and children understand the actual scope of the chosen specialisation, the opportunities available in their location and elsewhere, and the practical steps needed to build a career in that field.

What could make the app successful?

A genuine problem for parents
Parents often want to encourage a child's interests but do not know what activities, mentors, experiences or learning opportunities to provide. A structured, age-appropriate pathway could help them.

A plan that adapts to the child's age, experience, preferred art form, available time, location and budget is more useful

Curated workshops, verified mentors, local classes, competitions, performances and age-appropriate learning resources could make the app much more valuable than a planning tool alone.

Its stronger proposition would be to help families turn career exploration into real experiences and demonstrable progress.
